The 90° filling connection is basically a connection piece between the filling pump and the grease pump in lubrication technology.

The grease gets out of the filling cylinder through the 90° filling connection in the grease reservoir of the pump. After filling the grease reservoir of the pump, the filling connection will be closed and the single lubrication points can be supplied again with grease. The 90° filling connection as well as the filling connection straight provides just a dust-and dirt-free filling of the grease reservoir in lubricating technology.

Depending on the position of the pump, the 90° filling connection is not only a connection to the grease filling pump or to the grease reservoir, but also a relief for inaccessible positions of pumps in the lubricating technology.
